Pyroguard Balustrades glass ordering

1. 13 mm border (see above ) is black and must be shielded from direct UV with an appropriate U channel.
2. Inclusions, bubbles, and defects within the 18 mm border (see above ) are not considered faults.
3. The appearance of the laminated glass is based on the criteria detailed in BS EN ISO 12543-6:2011 "Glass in Building. Laminated Glass and Laminated Safety Glass. Evaluation of Conformity/Product Standard" and in BS EN 14449:2005 "Glass in Building. Laminated Glass and Laminated Safety Glass. Evaluation of Conformity / Product Standard".

4. (a) Any side of the pane likely to be in contact with a sealant should be taped with an approved tape before installation—surcharges apply. Alternatively, please add number of rolls of tape to your order overleaf.

Taping (see below —) will be done as standard on the base of the glass and on uprights to 150 mm —trim the tape to match the depth of trench in use.

(b) Alternatively, compatible sealant can be supplied by Pyroguard or ordered directly from the manufacturer (see overleaf).

5. Provide drawing detailing stamp location x, y (mm). Standard Pyroguard location is x, y 40 x 40 (mm). Standard balustrade is location is x, y 40 x 150 (mm).

Stamp location (x,y)	
40 x 150	<input checked="" type="checkbox"/>
40 x 40	<input type="checkbox"/>
Other (_____, _____)	

6. Stamp dimensions approx. 35 (w) x 40 (h) (mm).
7. Provide pane dimensions in mm in format w x h (mm).

Additional order items

Sealant: Only the bonding sealant listed here are proven compatible with the glass edge sealant. Installers must independently satisfy themselves of the compatibility with the surrounding of the install.

What is Pyroguard T?

Pyroguard T is a fire safety glass, provided for balustrade application where the reaction to fire properties are required to be of the highest standard. It is classified A2 s1, d0 according to BS EN 13501-1-2018.

The product consists of toughened glass, conforming to EN12150, laminated with a fireproof interlayer made from a nanocomposite silica.

The product thickness can be modified depending on the loading protection required.

- [1] Tempered glass
- [2] Spacer
- [3] Sealant
- [4] Nanocomposite silica interlayer

The test results for loading are specific to the system that it is glazed in.

Pyroguard Balustrades do's and don'ts

DO THIS!

- Install in a load tested system. Suitable for installation freestanding in a U channel 'shoe' (as below) or in Juliet style.

- [1] Laminate
- [2] Packer
- [3] U-channel 'shoe'

- Conceal the edge sealant in a stiff steel or aluminium U-shaped channel on all exposed edges.
- The edges must be covered (fully-framed), glass edges taped where in contact with non-compatible sealants (i.e. anything but the specified sealant), or use of an approved sealant.
- The shoe must be drained to avoid the glass sitting in standing water.

- [1] Tempered glass
- [2] Spacer
- [3] Sealant
- [4] Nanocomposite silica interlayer
- [5] Edge concealing U-channel

- Glaze the Pyroguard glass with the stamp installed at the bottom edge as the sticker indicates.

- Apply Vitominium PET tape to the edges if it is unavoidable for the Pyroguard T glass to be in contact with a non-approved sealant.

DON'T DO THIS!

- Don't bond in the glass with a non-approved sealant
- Don't install with edge sealant exposed to direct sunlight
- Don't grout seal
- Don't install into an undrained channel

Important information

- Failure to follow the above guidance will render the warranty void
- The optical properties of fire-resistant laminated glass, unlike in standard laminated glass, are dependent on the type and number of constituents (glass, interlayers, laminate PVB, etc.). These constituents may have detrimental effect on the optical qualities of the laminate. The primary function of fire-resistant laminated glass is to provide protection from fire and to allow light through, and therefore any reduction in optical quality must be accepted as a consequential effect.
